## Adobe Adds Sophisticated Blogging Capabilities to Contribute 4

Adobe Contribute 4 makes it easy for web designers and developers, as well as web administrators to help their users get started with blogs using the same familiar environment they use to update Web site content. Contribute also supports the most popular blog servers -- **Blogger, Typepad, and Wordpress** (*but not ColdFusion-based BlogCFC unfortunately*)-- and gives the option of connecting to in-house blog servers, straight out of the box. Rich media support has been enhanced in Adobe Contribute 4 enabling users to drag and drop images, movies, and now Adobe Flash<sup>®</sup> video files into their Web pages or blog entries. In addition, users can publish content from a browser to their Web site and blog. Contribute maintains the original formatting and automatically posts the source for the content as well as a link.

## With Adobe<sup>®</sup> Contribute<sup>®</sup> 4, anyone can quickly, easily, and safely update existing websites and blogs.

With Adobe Contribute 4, anyone can update website content or create blog entries using a single application. True WYSIWYG authoring capabilities let users edit any website or blog in three simple steps, dramatically reducing editing time. Simply browse to the website or blog entry, click Edit to make changes, then click Publish when ready to post the new content. Alternatively, authors can publish directly from within Microsoft Office applications including Word, Excel and Outlook with the click of a button. Just open the document that contains the content to publish, click Publish, and select the target website or blog.
