This post is just to be a handy reference for CFMX JDBC driver versions. Using the following code (once posted to CFTalk by Dave Carabetta), JDBC driver version information was generated and written to the {servername}-out.log.

```
[cfset drivernames =
"macromedia.jdbc.oracle.OracleDriver,
macromedia.jdbc.db2.DB2Driver,
macromedia.jdbc.informix.InformixDriver,
macromedia.jdbc.sequelink.SequeLinkDriver,
macromedia.jdbc.sqlserver.SQLServerDriver,
macromedia.jdbc.sybase.SybaseDriver">

[cfset drivernames = replace(drivernames, " ", "", "ALL")>
[cfloop index="drivername" list="#drivernames#">
[cfobject action="CREATE" class="#trim(drivername)#" name="driver" type="JAVA">
[cfset args= ArrayNew(1)>
[cfset driver.main(args)>
[/cfloop>
Look in default-out.log for results of driver version info
```
