A **new technote** was published today regarding Macromedia's assesment, solutions, and workarounds for various circumstances which may lead to the observed symptom most commonly described as "ColdFusion hangs".

There are three known, primary causes of the behavior:

- Using an IP address instead of machine name when configuring a dsn for sql server
- Having an intentionally long running Oracle query(s) that share the same connection pool as normally fast running Oracle queries.
- When Oracle is configured to close idle connections at a shorter interval than CFMX

The article has workarounds for each of these.
