Clicking the **Browse Server** button in the ColdFusion MX 6.0/6.1 Administrator while RDS is disabled will cause a pop-up alert as shown here. The Browse Server button is part of an Applet built into the Administrator and is used for a variety of tasks, such as selecting the appropriate *.mdb file when creating an Microsoft Access Database Datasource from the CF Admin. If RDS was selected to be disabled during the post-installation configuration wizard, a recommended practice for production servers, then the

Browse Server functionality will not work from the ColdFusion Administrator. There is no workaround other than to re-enable RDS in the deployment descriptor web.xml, found at {CF_HOME}/wwwroot/WEB-INF/web.xml. Refer to this [document](#) for how to enable/disable RDS. This issue is available as a [TechNote](#).
