I've been using PHP for years now just so I could run PHPMyAdmin, but now Daniel Mackey of **Digital Crew** has written a ColdFusion based interface for managing MySQL database servers, **CFMyAdmin**. Fantastic! I can't wait to start using it. Daniel announced this new product on the CFTalk list today, and here is his post (reprinted with permission):

Hi All,

Just a quick email to introduce a new **free** tool we have developed for ColdFusion Developers looking for an online MySQL Management Tool called CFMyAdmin. Full details, screenshots and free download is available at:

<http://www.cfmyadmin.com>

This is the first public release and is at Version 1.0 Beta. Many features are fully implemented with more to be released very soon.

Please provide some feedback in the Support Forums, any suggestions, comments or queries are very much appreciated.

Thanks again and we look forward to handing over the keys to a tool we feel has alot of potential in the future for ColdFusion Developers!

Regards,

Dan.
