Tom Jordahl, Macromedia Server Development Engineer, just blogged some very interesting information about how the tag CFHTTP caches DNS information until the server is restarted, so should the DNS change then CFHTTP won't know about it.

This is the first time I've seen Tom's blog, and I haven't seen anyone else mention it, so I think its worth my own blog entry to help point people to it. Other than being perhaps the best ColdFusion Engineer at Macromedia, Tom is **the** best Unix/Linux guru, and he's also on the **W3C Web Services Description Working Group**.

Check it out.

Damon Cooper, Director of ColdFusion Engineering, **blogged about this** too...
